No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                    The present sequence is that of an isolated nucleic acid, designated ESP002_C2, of Exophiala spinifera isolate ESP002, which encodes an amino polyol amine oxidase (APAO, see AAY58900) capable of degrading fumonish, its hydrolysis product API, and related mycotoxins. The DNA was obtained by PCR amplification of related mycotoxins. The DNA was obtained by PCR amplification of ESP002 mycellal DNA using primers based on APAO of E. Spinifera ATCC 74269. The invention provides APAO polynucleotides (see AAX58383-87) and polypeptides (see AAY58900-05) of E. spinifera and AAX58383-87) and polypeptides (see AAY58900-05) of E. spinifera and plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Transgenic plants can be regenerated from the transformed plant cells. Also provided are methods for expressing both APAO and a fumonish-esterase in a transgenic plant, and for producing APAO enzyme in prokaryotic and non-plant eukaryotic systems. Transgenic plants capable of degrading fumonish or of producing the degrading enzymes are provided. Methods for special processing, silage, food crops and the animal feed and rumen migrocaganisms are also disclosed. APAO

The present sequence is that of an isolated nucleic acid, designated ESP002_C3, of Exophiala spinifera isolate ESP002, which encodes an amino polyol amine oxidase (APAO, see ARYS8901) capable of degrading fumonisin, its hydrolysis product API, and related mycotoxins. The DNA was obtained by PCR amplification of ESP002 mycolial DNA using primers based on APAO of E. spinifera ATCC 74269. The invention provides APAO polynucleotides (see AAXS833-87) and polypeptides (see AAYS8900-05) of E. spinifera and Rhinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing plant cells normally susceptible to Fusarium or other toxin-producing cannot a fumonisin-esterase in a transgenic plant, and for producing APAO and a fumonisin-esterase in a transgenic plant, and for systems. Transgenic plants capable of degrading tumonisin or of producing the degrading enzymes are provided. Methods for cops and detoxification of grain, grain processing, silage, food crops and channal feed and rumen microcranisms are also disclosed. APAO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 300

The polynucleotide was obtained by 3' and 5' RACE PCR using k0n0-395.5 (see AAXE888), a partial APAO cDNA of Exophiala spinifera. APAO is capable of degrading fumonisin, its hydrolysis product API and related myxotoxins. The invention provides APAO polynucleotides (see AAXE8888-87) and polypeptides (see POLYNUCLEOTIGES TO SPINIFERA ANXE8980-05) of E. spinifera and Rhinocladiella atrovirens. The susceptible to Fusarium or other toxin-producing fungus infection. Also provided are methods for expressing APAO in transgenic plants, prokaryotic and non-plant eukaryotic systems. Methods for

```
oxidase (APAO). The enzyme has homlology to the flavin containing amine oxidase family, that oxidise primary amine to an aldehyde or ketone, releasing ammonia and hydrogen peroxide. The APAO enzyme degrades mycotoxins that promote fungal invasion of plants. Destruction of mycotoxins by APAO generates, as a by-product, hydrogen peroxide which is itself a antimicrobial and stimulates the plants own defensive systems. The APAO polynucleotides are used to generate plants (particularly maize) that are resistant to Fusarium or other funging that produce mycotoxins and/or to degrade such mycotoxins (e.g. during ensitaging); for recombinant production of APAO polypeptides; as selection markers for plant transformation; and to isolate related sequences from other organisms. The APAO polypeptides are used to degrade mycotoxins in plant materials, including expression in engineered bacteria and fungi, e.g. rumen microflora.

The present sequence encodes an Exophiala spinifera aminopolyol amine oxidase (APAO). The enzyme has homlology to the flavin containing amine oxidase family, that oxidase primary amine to an aldehyde or ketone, releasing ammonia and hydrogen peroxide. The APAO enzyme degrades mycotoxins that promote fungal invasion of plants. Destruction of mycotoxins by APAO generates, as a by-product, hydrogen peroxide which is itself an antimiorobial and stimulates the plants own defensive systems. The APAO polynucleotides are used to generate plants (particularly maize) that are resistant to Fusarium or other fungit that produce mycotoxins and/or to degrade such mycotoxins (e.g. during ensilaging); for recombinant production of APAO polypeptides; as selection markers for plant transformation; and to isolate related sequences from other organisms. The APAO polypeptides are used to degrade mycotoxins in plant materials, including expression in engineered bacteria and fungi, e.g. rumen microflora.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1018 CAATGGTCCATTACCTGTTTCATGGTCGGAGACCCGGGACGGAAGTGGTCCCAACAGGTCC 1077

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of a polynucleotide encoded a truncated, but still functional, amino polyol amine oxidase (K:trAPAO, see AAY5899) of Exophiala spinifera. The polynucleotide was derived from clone k000-395_6.5 (see AAZ5832) to which was added a 5' lysine codon (nucleotides 1-3), since many amine oxidases have a positively charged amino acid near the N-terminus and upstream of a dinucleotide binding capte. The construct allowed heterologous expression of trAPAO in plotha pastoris and maize. The polynucleotides APA58983-87) and polypeptides (see AAY58900-05) of E. spinifera and Rainocladdella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Evaarium or other toxin-producing fungus infection. Also provided are methods for expressing APAO in transfernic plants, prokaryotic and non-plant eukaryotic systems.

Methods for detoxification of grain, grain processing, silage, food crops and in animal feed and rumen microorganisms are also disclosed.

APAO polynucleotide can also be used as a selectable marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is that of polynucleotide k0n0-395_5.4, which encodes a truncated, but still functional, amino polyol amine oxidase (trAPAO-1. see AAY58907 and AAY58908). The polynucleotide was obtained by 3' and 5' RACE PCR using k0n0-395.5 (see AAZ58888), a partial APAO CDNA of Exophiala spinifera. APAO is capable of degrading fumonisin, its hydrolysis product AP1 and related myxotoxins. The invention provides APAO polynucleotides (see AAZ58383-87) and polypeptides (see AAY58900-05) of E. spinifera and Rhinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Also provided are methods for expressing APAO in transgenic plants,

                                                                                                                                                                                                                                                      The present sequence encodes an Exophiala spinifera aminopolyol amine oxidase (APAO). The enzyme has homlology to the flavin containing amine oxidase family, that oxidise primary amine to an aldehyde or ketone,
                                                                                                                                                                                                                                                                                                releasing ammonia and hydrogen peroxide. The APAO enzyme degrades mycotoxins that promote fungal invasion of plants. Destruction of mycotoxins by APAO generates, as a by product, hydrogen peroxide which is itself an antimicrobial and stimulates the plants own defensive systems. The APAO polynucleotides are used to generate plants (particularly maize) that are resistant to Fusarium or other fungi that produce mycotoxins and/or to degrade such mycotoxins (e.g. during ensilaging); for recombinant production of APAO polypeptides; as selection markers for plant transformation; and to isolate related sequences from other organisms. The APAO polypeptides are used to

ó
The present sequence is that of a polynucleotide encoding a fusion protein (see AAY58912) composed of the barley alpha-amylase signal peptide and KitzhAPAO (see AAY58909), a truncated, but unctional, amino polyol amino exidase of Exophiala spinifera. The construct was designed for expression and secretion of the construct was designed for expression and secretion of the construct was designed for expression and secretion of its rapable of degrading fumonisin and related mycotoxins. The invention provides APAO polynucleotides (see AAX58383-87) and polypeptides (see AAX58000-05) of E. spinifera and Rhinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Also provided are methods for expressing APAO in transgenic plants, provexivit and non-plant eukaryotic systems. Methods for detoxification of grain, grain processing, silage, food crops and in animal feed and rumen microorganisms are also disclosed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1555 CAATGGTCCATTACCTGTTTCATGGTCGGAGACCCGGGACGGAAGTGGTCCCAACAGTCC 1614

The present sequence encodes an Exophiala spinifera aminopolyol amine oxidase (APAO). The APAO enzyme has homlology to the flavin containing amine oxidase family, that oxidise primary amine to an oxidase family, that oxidise primary amine to an algeby de or ketone, releasing ammonia and hydrogen peroxide. The APAO enzyme degrades mycotoxins that promote fungal invasion of plants. Destruction of mycotoxins by APAO generates, as a by product, hydrogen peroxide which is itself an antimicrobial and stimulates the plants own defensive systems. The APAO polynucleotides are used to generate plants (particularly maize) that are resistant to Pusarium or other fungic that produce mycotoxins and/or to degrade such mycotoxins (e.g. during ensilaging); for recombinant production of APAO polypeptides; as selection markers for plant transformation; and to isolate related sequences from other organisms. The APAO polypeptides are used to degrade mycotoxins in plant materials, including expression in engineered bacteria and fungi, e.g. rumen microflora.
                                                                                                                                                                                                                                                                                                                                                                                                             fungi

The polynucleotide was designed for expression in Pichla pastoris. The encoded protein is capable of degrading fumonisin and related mycotoxins. The invention provides APAO polynucleotides (see AAZ58383-87) and polypeptides (see AAZ58900-05) of Expinifera and Rhinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing fungus infection. Also provided are methods for expressing APAO in transgenic plants, prokaryotic and non-plant eukaryotic systems. Methods for detoxification of grain, grain processing, sliage, food crops and in animal feed and rumen microorganisms are also be microorganisms are also be

The present sequence encodes a Exophiala spinifera aminopolyol amine oxidase (APAO). The enzyme has homlology to the flavin containing amine oxidase family, that oxidise primary amine to an aldehyde or Ketone, releasing ammonia and hydrogen peroxide. The APAO enzyme degrades mycocoxins that promote fungal invasion of plants. Destruction of mycotoxins by APAO generates, as a by-product, hydrogen peroxide which is itself an antimicrobial and stimulates the plants own defensive systems. The APAO polynucleotides are used to generate plants (particularly maize) that are resistant to Fusarium or other fungi

The present sequence is that of the coding region of full-length amino polyol amine oxidase (APAO) CDNA of Exophiala spinifera 2141.10. APAO is capable of degrading fumonishin, its hydrolysis product API, and related myochoxins. The invention provides APAO polyuncleotides (see AAZ5838-87) and polypeptides (see AAZ58300-05) of E. spinifera and Rhinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or ther toxin-producing fungus infection. Transgenic plants can be requerated from the transformed plant cells. Also provided are methods for expressing both APAO and a fumonisin-esterase in a transgenic plant, and for producing APAO enzyme in proxexryctic and non-plant eukaryotic systems. Transgenic plants capable of degrading fumonisin or of producing the degrading enzymes are provided. Wethods for decoxification of gradin, grain processing, silage, food crops and in animal feed and rumen microorganisms are also disclosed. APAO polynucleotide is also useful as a selectable marker.
             New isolated polynucleotides, polypeptides useful for detecting and degrading fumonish or structurally related mycotoxin in processed grain or in silage
                                                                            Example 10; Page 97-100; 154pp;

that produce mycotoxins and/or to degrade such mycotoxins (e.g. during ensilaging); for recombinant production of APAO polypeptides; as selection markers for plant transformation; and to isolate related sequences from other organisms. The APAO polypeptides are used to degrade mycotoxins in plant materials, including expression in engineered bacteria and fungi, e.g. rumen microflora.

                                                                                                                                                                                                                                                                                                                                       The present sequence encodes a full length Exophiala spinifera aminopolyol amino oxidase (APAO). The enzyme has homlology to the aminopolyol amino oxidase (APAO). The enzyme has homlology to the flavin containing amine oxidase family, that oxidise primary amine to an aldehyde or ketone, releasing ammonia and hydrogen peroxide.

The APAO enzyme degradese mycotoxins that promote fungal invasion of plants. Destruction of mycotoxins by APAO generates, as a by-product, plants own defensive systems. The APAO polymcieotides are used to generate plants (particularly maize) that are resistant to fusarium or char fungi that produce mycotoxins and/or to degrade such mycotoxins (e.g. during ensilaging): for recombinant production of APAO polymeptides; as selection markers for plant transformation; and to clayeptides; as selection markers for plant transformation; and to care used to degrade mycotoxins in plant materials, including expression in engineered bacteria and fungi, e.g. rumen microflora.

The present sequence is that of an isolated nucleic acid, designated ESP003_C12, of Exophiala spinifera isolate ESP002, which encodes an amino polyol amine oxidase (APAO, see AAY58902) capable of degrading fumonishi, its hydrolysis product API, and capable of degrading fumonishi, its hydrolysis product API, and capable of degrading fumonishi, its hydrolysis product API, and capable of degrading fumonishi, its based on APAO of E. spinifera arcording primers based on APAO of E. spinifera arcording provides APAO polynucleotides (see AAX5893-87) and polypeptides (see AAX5890-05) of E. spinifera and Phinocladiella atrovirens. The polynucleotides are used to transform plant cells normally susceptible to Fusarium or other toxin-producing transformed plant cells. The provided are methods for expressing both APAO and a fumonisin-esterase in a transgenic plant, and for systems. Transgenic plants capable of degrading fumonisin or of producing the degrading enzymes are provided. Methods for capable of getoxification of grain, grain processing, silage, food crops and in animal feed and rumen microcyanisms are also disclosed. APAO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Amino polyol amine oxidase; fumonisin; mycotoxin; transgenic plant; detoxification; animal feed; silage; selectable marker; ds.

DKFZp686H1969_r1 686 (synonym: hlcc3) Homo saplens cDNA clone
DKFZp686H1969 5', mRNA sequence.
AL710341
/clone_lib-"Plasmodium yoelii infected liver tissues"
/tissue_type="liver"
/note="Organ: liver; P. yoelii sporozoites were IV
injected into BALB/c mice and livers were harvested 24
hours post injection. Total RNA was processed and
differential display was performed on the infected liver
samples along with uninfected BALB/c liver control."

This is single pass sequence recovered from the left border of
TDNA. This sequence lies within an annotated exon of Atlg47210 and
an annotated exon of Atlg47210.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

ECORI; cDNA made by oligo-dT priming. Directionally cloned into EcoRI/XhoI sites using the following 5' adaptor: GGCACGAG(G). Size-selected >500bp for average insert size 1.8kb. Library constructed by Ling Hong in the laboratory of Gerald M. Rubin (University of California, Berkeley) using ZAP-cDNA synthesis kit (Stratagene) and Superscript II RT (Life Technologies).
                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 10,

Sequence 10, Application US/09352159A

Patent No. 6211434
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: GIlliam, Jacob T.
TITLE OF INVENTION: Amino Polyol Amine Oxidase
TITLE OF INVENTION: Polyuclectides and Related Polypeptides and Methods of Use
TITLE REPRENCE: 1134
CURRENT APPLICATION NUMBER: G0/092,936
EARLIER APPLICATION NUMBER: 60/092,936
EARLIER APPLICATION NUMBER: 60/092,936
EARLIER APPLICATION NUMBER: 60/135,391
EARLIER FILING DATE: 1999-07-25
SEARLIER APPLICATION NUMBER: 60/135,391
NUMBER OF SEQ ID NOS: 46
SOFTWARE: FastSEQ for Windows Version 3.0
                                                                                                                                                                                                                                                           1555 CAATGGTCCATTACCTGTTTCATGGTCGGAGACCCGGGACGGAAGTGGTCCCAACAGTCC 1614

Sequence 7, Application US/09352159A

Patent No. 6211434

GENERAL INFORMATION:
APPLICANT: Duvick, Jonathan P.
APPLICANT: Maddox, Joyce N.
TITLE OF INVENTION: Amino Polyol Amine Oxidase
TITLE OF INVENTION: Polynuclectides and Related Polypeptides and Methods of US
FILE REPERBNCE: 113
CURRENT APPLICATION NUMBER: US/09/352,159A

CURRENT FILING DATE: 1999-07-12

EARLIER FILING DATE: 1998-07-25

EARLIER FILING DATE: 1998-05-21

SAFRIER FILING DATE: 1999-05-21

NUMBER OF SEQ ID NOS: 46

SOFTWAME: FastSEQ for Windows Version 3.0

NAME/KEY: CDS
LOCATION: (1)...(1461)
OTHER INFORMATION: Nucleotide sequence of K:traPAO translational
OTHER INFORMATION: fusion with barley alpha amylase signal sequence,
OTHER INFORMATION: for expression and secretion of the mature traPAO
OTHER INFORMATION: in maize. Nucleotides 1-72, barley alpha amylase
OTHER INFORMATION: signal sequence, nucleotides 73-75, added lysine
OTHER INFORMATION: residue; nucleotides 76 -1464 , traPAO cDNA.

Sequence 10314, Application US/09878574

Patent No. US20020110548A1

GENERAL INFORMATION:
APPLICANT: La ROSEPH R.

APPLICANT: Thompson, Michael D.

TITLE OF INVENTION: Nucleic Acid Molecules and Other Molecules Associated with
TITLE OF INVENTION: Diants

FILE REFERENCE: 38-21(15401)B

CURRENT APPLICATION NUMBER: US/09/878,574

CURRENT FILING DATE: 1999-06-14

PRIOR PPLICATION NUMBER: 09/333,535

PRIOR PPLICATION NUMBER: 09/333,535

NUMBER OF SEQ ID NOS: 15775

SEQ ID NO 10314

LENGTH: 239
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 7447, Application US/09878574

Patent No. US20020110548A1

GENERAL INFORMATION:
